

CHAPTER V

AREA AND PRODUCTION OF CROPS AND CROP UTILIZATION

1 INTRODUCTION

Ethiopian farming largely produces only enough food for the peasant holder and his family for consumption, leaving little to sell. This inadequate volume of production is ascribed to the tardy progress in the farming methods and scattered pieces of land holdings. Under this traditional sector, agriculture is practiced on public land and most of the produce is mainly for own consumption. The diverse climate of the country and the multiple utilizations of crops have prompted the vast majority of agricultural holders to grow various temporary and permanent crops. Despite the variation in the volume of production, the relative importance and pattern of growth of these crops are largely similar across many of the regions. This similarity is well observed and demonstrated in the statistical tables presented in this report. In some regions there seems to be a shift in choice of crops grown. Teff, barley and wheat do not figure prominently. Instead, maize, millet and sorghum are grown in greater volume than these crops. Bensihangul-Gumuz is a case in this point.

There is a general agreement that the performance of an agricultural system should achieve a steady supply of food to the people of a country. But, unless special attention is focused on agriculture its performance can be impeded by vagaries of nature, population growth and scarcity and fragmentation of land, thus, affecting food supply and posing a challenge to the federal and regional governments. This situation calls for an overhaul of the agricultural system in the country or the regions.

In order to have a flourishing agriculture, which sustains reliable food supply, the federal and regional governments have to formulate and implement farm programs that ensure food security. The preparation, execution, monitoring and assessment of these programs entail statistics on agriculture particularly

crop production since it is the prime target that national or regional agricultural policies aim at.

The collection of data on crop production should encompass all crop seasons in the agricultural calendar and farming activities in both rural and urban areas. It should also include the wide range of crops that are grown and embodied in the food security system, which are indispensable for a sustained provision of staple diet and other cash crops like coffee and Chat.

In view of this, crop production data for private peasant holdings for both Meher and Belg seasons in both rural and urban areas were collected in the census to provide the basis for decision making in the process of implementing timely food security measures and to make policy makers aware of the food situation in the country.

Thus, in this chapter the census data on production of temporary/annual crops such as cereals, pulses, oilseeds, vegetables and root crops are presented in Section 2. Also production of permanent crops that included fruit crops, stimulant crops and other permanent crops are dealt with in Section 3. Moreover, the utilization of temporary crops as well as permanent crops for various purposes such as household consumption, seed, sale, paying wages in kind ...etc are indicated in Section 4. Furthermore, these census data are presented for all the weredas in the region. Hence, tables providing these data at wereda level are also given at the end of the chapter. S.E and C.V are provided as an annex to this chapter.

2. PRODUCTION OF TEMPORARY / ANNUAL CROPS

The types of temporary crops on which data were collected during the census are those that food security embraces: that is, the crops that are the staple diets in the country. In the statistical tables, these crops have been categorized into five groups for simplicity of description and comparison purposes. The

groups are cereals, pulses, oilseeds, vegetables and root crops. The crops within each group have some similarity, which made the categorization necessary.

2.1 Cereals

These are crops that are produced in greater volume compared to the other crops because they are the principal staple crops and export commodities at times of bumper harvest in the country. Between the months of September 2001 and August 2002 it was learned that 242,794 quintals of cereals worth 106,028,521 Birr was exported from Ethiopia to various countries (CSA, external trade statistics).

Cereals are grown in almost all regions of Ethiopia with notable variation in the extent of areas planted and the volume of production obtained. This variation is seemingly caused by a shift in choice of crops by the holders and difference in weather conditions. Summary Tables V.1 and V.2 reinforce this thought further by giving a highlight on the size of area planted to sorghum, maize, and finger millet and volume of production of these crops harvested in Benishangul-Gumuz region when compared to Teff, barley and wheat produced in the same region.

Summary Tables V-1 and V-2 show that 76.13% of the regional grain crop area was devoted to cereals and 88.00% of the grain production was that of cereals. Out of all area under grain, sorghum, maize and finger millet took up 38.00%, 15.19% and 12.95%, yielding 42.27%, 26.05% and 12.86% of the regional grain production, respectively.

Summary Tables V-3 – V-8 present the census data on area and production of temporary crops at zonal level for Benishangul-Gumuz Region. Summary Tables V-3 and V-4 indicate that 75.38% of the zonal grain crop area was under cereals and 86.07% of the production was made up of the same crops in

Metekel zone. Sorghum, finger millet and Teff, which accounted for 28.19%, 24.20% and 9.97% of the area under grains, were the major crops in the zone respectively. The zonal grain production was composed of 33.15% sorghum, 24.09% finger millet and 17.31% maize.

Summary Tables V-5 and V-6 show that 75.89% of the grain crop area was under cereals and 89.44% of the grain production was drawn from these crops in Asosa Zone. Sorghum, maize, and Teff were the major cereal crops in the zone accounting for 47.75%, 19.26% and 6.46% of the zonal area under grain crops and 52.23%, 32.44% and 2.59% of the zonal grain production, respectively.

Summary Tables V-7 and V-8 point out that 79.24% of the grain crop area in Kemashi zone was under cereals and 90.42% of the zonal grain production was that of cereals. Sorghum, maize and finger millet were the major cereal crops in terms of area planted and production attained accounting for 45.13%, 26.14%, and 4.17% of the area under grain crops and 49.08%, 37.25%, and 2.66% of the grain production in the zone in that order.

2.2 Pulses

These crops are essential part of the dietary requirements for most Ethiopians. They also form a significant commodity group of export, earning a considerable amount of foreign exchange for the country and cash for peasant farmers. In 2001/02 (1994) E.C, between the months of September and August, 1,229,366 quintals of pulses valued at 351,997,759 Birr was exported from Ethiopia to various countries (CSA, external trade statistics). These are some of the grounds for growing various pulses in all regions of the country with varying quantities. There is no doubt that economic benefits can accrue to the country from the production and export of more pulses if the agriculture in Ethiopia is given due attention in this regard.

A view of Summary Tables V-1 and V-2 enables to detect that only 4.92% of the regional grain crop area was under pulses and 3.83% of the grain production consisted of the same crops. Of the regional area under grain crops, 2.79% was planted to haricot beans. The production obtained from haricot beans was 2.18% of the regional total.

In Metekel Zone, 6.60% of the grain crop area and 5.64% of the grain production were that of pulses. In this zone haricot beans, soya beans and field peas were the major pulses, which took up 3.16%, 1.20% and 1.07% of the area under grain crops, in that order. The principal crops in terms of volume of production were haricot beans and soya beans that formed 2.63% and 1.38% of the zonal production of grains, in that order.

In Asosa Zone, 3.89% of the grain crop area was under pulses and 2.70% of the zonal grain production was drawn from these crops. The major pulse in terms of area in the zone was haricot beans which took up 2.66% of the area under grain crops in the zone. The zonal production of grains is composed of 2.14% haricot beans.

In Kemashi Zone 1.99% of the grain crop area and 1.24% of the grain production were that of pulses. The principal pulse in terms of both area and production was haricot beans, which was 1.91% of the area and 1.20% of the production of grains in the zone.

2.3 Oilseeds

These crops are also of paramount importance as a source of cooking oil used to provide the fat required in the food consumed by the residents in the region. Moreover, oil crops have become a major commodity of export earning a great deal of foreign exchange. Between September 2001 and August 2002, Ethiopia exported 953,088 quintals of oilseeds valued at 351,952,634 Birr

(CSA, external trade statistics) signaling that an increase in the production and export of these crops will definitely generate more money.

Summary Tables V-1 and V-2 indicate that 18.95 % of the regional grain crop area was under oilseeds and 8.17 % of the regional grain production was that of the oil seeds. Of the total area under grain crops and grain production in Benishangul-Gumuz Region, 9.80% and 2.45% went for Neug, 6.95% and 4.01% for sesame and 1.92 % and 1.60% for groundnuts, in that order.

As shown in Tables V-3 and V-4, in Metekel Zone, 18.02% of the zonal grain crop area and 8.29% of the volume of grain production were that of oilseeds. Out of the zonal area under grain crops, Neug, sesame and groundnuts took up 9.05%, 5.31% and 3.32%, respectively. The same crops made up 2.24%, 2.94 % and 2.94% of the zonal grain production, in that order.

In Asosa Zone, 20.21% of the zonal grain crop area was under oilseeds and 7.87% of the total volume of grain production in the zone was drawn from the same crops. Of all the zonal area under grain crops, 13.54% and 5.56% were those of Neug and sesame respectively. The volumes of production of these crops were 4.01% and 3.25% of the zonal total grain production, in that order.

Similarly in Kemashi Zone, 18.77% of the zonal grain crop area was under oilseeds and the same crops added 8.35% of the grain production to the zonal total. Neug and sesame accounted for 2.50% and 16.06% of the zonal grain crop area and 0.64% and 7.64% of the grain production in the zone, respectively.

2.4 Vegetables

These crops like fruits are also a good source of nourishment necessary for the healthy growth of humans. Dieticians often advise people to eat more of vegetables for their nutritional values. Vegetables are relatively cheaper and

better available than other farm products in urban centers because these crops are usually grown as garden produces sometimes using irrigation. It may be worth to know that a certain amount of foreign exchange is drawn from vegetable exports. For instance between September 2001 - August 2002 Ethiopia exported 61,070 quintals of vegetables worth 11,543,144 Birr to various countries (CSA, external trade statistics). Thus, on the grounds that vegetables are nutritionally and economically important, it is worth expanding vegetable farming. When one looks at Summary Tables V-1 – V-8 to have a picture of the vegetable production in Benishangul-Gumuz region one realizes that a lot has to be done in this regard.

Summary Tables V-1 and V-2 show that tomatoes, green peppers and red peppers took up 2.35 %, 2.68% and 90.14% of the regional area under vegetables, respectively. These vegetables made up 4.76%, 10.82% and 67.19 % of the vegetable production in the region, in that order.

In Metekel Zone, Ethiopian cabbage, green peppers and red peppers covered 1.91%, 2.42% and 95.39% of the zonal area under vegetables, respectively. The production of these vegetables was 6.55%, 11.33% and 80.10% of the zonal volume of vegetable production, in the same order.

In Asosa Zone, green peppers, tomatoes and red peppers were planted in 1.38 %, 4.48% and 85.89% of the zonal area under vegetables, respectively. The same vegetables yielded 4.36%, 7.24% and 61.37% of the zonal volume of vegetable production, in that order.

In Kemashi Zone, green peppers and red peppers accounted for 11.87% and 85.23% of the zonal area under vegetables, respectively. The same crops contributed 47.41% and 48.34% to the zonal vegetable production, in that order.

2.5 Root Crops

Some root crops like onion and garlic are indispensable part of the daily meal of the Ethiopian population. These crops are essential to improve the taste and scent of the food. Potato, which is one of nature's precious gifts, is also very common in the dishes of most Ethiopians. This importance necessitated the growth and production of many of the root crops throughout the year often via the use of irrigation. Root crops are also a good source of cash and foreign exchange for the growers and the country, respectively. In 2001/02 (1994 E.C), the country has acquired a sum of 22,423,972 million Birr by exporting 120,497 quintals of root crops (CSA, external trade statistics). The economic and nutritional importance of root crops has been a factor for practicing the agriculture in all the regions and growing the crops more than one time in a year.

Summary Tables V-1 and V-2 indicate the root crop situation in Benishangul Gumuz Region. As the tables show, potatoes and sweet potatoes shared 60.08% and 31.23% of the regional root crop area, respectively. The same crops added 53.53% and 36.15% to the regional volume of root crop production, in that order.

In Metekel Zone, about 89.40%, 3.97% and 4.12% of the zonal root crop area were planted with potatoes, garlic and sweet potatoes, which resulted in 86.12%, 6.37% and 5.00% of the zonal root crop production, in that order.

In Asosa Zone, onion, potatoes and sweet potatoes shared 11.30%, 12.83% and 72.51% of the zonal root crop area, respectively resulting in 10.25%, 11.14% and 74.92% of the zonal root crop production, in that order. In Kemashi Zone, potatoes and sweet potatoes covered 24.79 % and 70.14 % of the root crop area in the zone. Onion, Taro/Godere and sweet potatoes contributed 1.65%, 1.14 % and 93.30 % to the zonal root crop production, respectively.

SUMMARY TABLE V-1 AREA UNDER TEMPORARY CROPS BY CROP TYPE
FOR PRIVATE PEASANT HOLDINGS

Benishangul-Gumuz Region

Crop	All		Rural		Urban

3. PRODUCTION OF PERMANENT CROPS

Permanent crops are long term crops that occupy the field planted for a long period of time and largely harvested every year and do not have to be replanted for several years after each harvest. These include tree crops such as coffee, Enset, Chat, oranges, mangoes, bananas, papayas, avocados... etc. The trees that yield fruits like oranges; mangoes, papayas, apples and others are also known as fruit trees.

Permanent crops are a good source of cash both for the holders and the country generating handsome income and foreign exchange at the best of times. For instance, between September 2001 and August 2002 Ethiopia exported 53,142 quintals of fruits and nuts and 91,705 quintals of Chat valued at 16.5 and 426.7 million Birr, respectively, (CSA, external trade statistics). With these bits of information and the dietary and economic importance of the crops in mind, it is not difficult to project the profits that can be reaped from the permanent crops if the farming in this regard is well developed and managed.

Fruits are not only a source of cash but are also a reliable source of nutrition that is essential for the health and growth of humans. There has even been an oft-repeated advice from health authorities that we should include fruits in our daily dish to make it nutritious. The two points made on the importance of permanent crops underscore the fact that fruit farming should be encouraged and expanded to have a steady supply of the desired products.

It is possible to conjecture that permanent crops in Ethiopia are not as well developed as they are in other countries. But the potential to develop them is great as Ethiopia is blessed with diverse climate conducive to the crops. In order to direct efforts towards the development of permanent crops, one requires statistical data regarding this sector of the agriculture. Adequate data on type and volume of production, area under permanent crops and their distribution have not been available. Hence, to bridge up this gap and alleviate the chagrin to data users the CSA has collected data on permanent crops.

Prior to the census, the CSA surveyed the situation about permanent crops in the country and then decided on the types of permanent crops, range of data items and method of enumeration

to be included in the census. Hence, only major permanent crops were covered during the census. Data on the types of crops were collected by holder interview while area and yield data were recorded by objective measurements. The numbers of Hops (Gesho) and fruit trees with the exception of pineapple were determined by counting the plants excluding seedlings.

In estimating the production of permanent crops, area, yield per unit area, yield per tree and number of fruit bearing trees are essential ingredients. These inputs were determined by physically measuring the area under crops in question, picking fruits, coffee berries and Chat produce from randomly demarcated plots or selected trees. The method involved crop cutting from small plots of rectangular shape of different sizes randomly placed in the selected crop field and a tree of fruit bearing age selected from all fruit bearing trees for each crop type and subsequent husking, drying weighing and recording the weight of the harvest of permanent crops. The crop cutting was performed for a sub sample of 20 households of the 30 households selected in each enumeration area. A 4m X 4m plot was demarcated for coffee and Chat and a 2m X 2m for pineapple and 1m X 1m plot for sugar cane were designated for the crop cutting exercise. The yields harvested from these plots and trees were immediately weighed (green weight) and/or weighed again after two weeks of drying to conform to the normal holder harvesting and drying practices. The coffee weight registered was that of clean coffee beans and the hops (Gesho) weight taken was that of the dry one. The green and dry weights were recorded on the appropriate forms.

For simplicity of description of the statistical tables and comparison purposes permanent crops have been grouped into three categories. Each category has a semblance of similarity, which necessitated the categorization. The categories are fruit crops, stimulant crops and other permanent crops. These categories include only permanent crops on which yield data have been collected.

3.1. Fruit Crops

Various kinds of fruit crops grow in different regions of the country yielding varying quantities of fruits within the private peasant holdings in the traditional way. There are also a few fruit

farms that are run by enterprises in the modern way. The volume of fruit production obtained from the peasant farms is small signalling the absence of development in fruit farming. A look at the tables helps to crystallize this point.

Benishangul-Gumuz is said to be one of the regions producing plenty of fruits, especially mangoes. This is more evidenced by the statistical tables on permanent crops. As Summary Table V-9 shows about two and half thousand hectares of land is under permanent crops in the region. Fruit crops constituted less than half (46.59%) of the permanent crop area yielding about 80.47 thousand quintals of fruits. Mangoes, bananas and papayas shared 47.74%, 35.68% and 9.70 % of the fruit crop area and 54.76%, 28.92% and 13.51% of the fruit production, in that order.

A glimpse of Tables V-10 – V-12 gives a picture of the zonal distribution of permanent crop area and production. In Metekel Zone, bananas, mangoes and papayas took up 48.71%, 24.23% and 15.84% of the zonal fruit crop area resulting in 34.34%, 5.15% and 56.43% of the fruit crop production, in that order.

In Asosa Zone, mangoes, bananas and papayas constituted 49.66%, 33.00% and 10.40% of the zonal fruit crop area and 58.29%, 27.39% and 11.22% of the fruit production, in that order.

In Kemashi Zone, mangoes and bananas contributed about 60.63% and 34.49% of the fruit crop area and 65.30% and 31.96% of the fruit production in the zone, in that order.

3.2. Stimulant Crops

This category embraces cash crops like coffee and Chat, which are extensively grown in many parts of the country. It is needless work to verify by quoting statistical evidences that coffee is a major foreign exchange earner. It may not be even surprising to hear that Chat farming is becoming a rapidly expanding phenomenon in Ethiopia because of its economic importance. As the census covered a wide range of crops, the statistics on Chat would perhaps be more tantalizing than the others. Summary Table V-9 shows the situation in which coffee, Chat, hops (Gesho) are found in Benishangul-Gumuz Region.

The data in the table demonstrates, more than half (51.15%) of the regional permanent crop area is under stimulant crops. Of the total area under stimulant crops in the region, 84.82% is that of coffee resulting in 71.38% of the volume of stimulant crop production. About 9.91% of the regional stimulant crop area and 10.93% of the production were that of Chat.

In Metekel Zone, 75.45% of the permanent crop area was under stimulant crops. Of the zonal stimulant crop area 90.98% was under coffee yielding 76.17% of the production of this crop.

In Asosa Zone, 44.89% of the zonal permanent crop area was under stimulant crops. Of the zonal stimulant crop area 80.98% and 16.45% were under coffee and Chat, respectively. The zonal stimulant crop production consisted of 65.30% coffee and 23.24% Chat.

In Kemashi Zone, stimulant crops took up 11.98% of the zonal permanent crop area and about 49.52% of the zonal stimulant crop area was that of coffee.

3.3. Other Permanent Crops

This group includes sugar cane on which yield data have been collected. Though, sugar cane is an industrial crop it looks that it is not widely practiced by the private peasant holders, as the statistics seem to indicate. It is produced on a small scale by private peasant holders in some pockets of the country and usually does not end up in sugar cane processing plants. The sugar factories in Ethiopia run extensive sugar cane plantations. As the statistics indicate 660,146 quintals of sugar worth 111,773,918 Birr was exported between September 2001 and August 2002 (CSA, external trade statistics).

Summary Table V-9 sheds some light on the production of sugar cane in Benishangul-Gumuz Region. This crop covered 2.26% of the regional permanent crop area. The result also indicates that two thousand quintals of sugar cane was produced in the region.

Summary Tables V-10 – V-12 show the zonal distribution of other permanent crop (sugar cane) in the region. As shown in the table, in Metekel Zone, 1.38% of the area under

permanent crop was mainly for sugar cane. In Asosa Zone, 2.98% of the area under permanent crop was also that of sugar cane. More than 1,500 quintals of sugar cane was produced in Asosa Zone. In Kemashi Zone, the area under sugar cane was negligible yielding over 100 quintals of it.

4. CROP UTILIZATION

Agriculture is the livelihood of the overwhelming majority of the Ethiopians. It is the source of food and cash for those who are engaged in it and others. Most agricultural holders acquire the food they eat and the cash they need to cover other expenses only from farming activities. Since farming in Ethiopia is often precarious and usually at the mercy of nature, it is invariably an arduous struggle for the holders to make ends meet. This, it often transpires, is true to the frequent shortfalls in the volume of production that occur in the country.

It is often said that what most Ethiopian agricultural holders produce is only enough to live, hand to mouth. This would be better said if it was statistically substantiated. There is plenty of information on the volume of crops produced within the private peasant holdings. But there is hardly any information on how the peasants utilize the crops they produce which will be indicative of the fact whether the holders have enough or little to sell in order to meet other expenses for living. For use in the census taking, crop utilization was defined as the amount of agricultural produce used for own consumption, sale, seed, and wages in kind, animal feed and other purposes.

In light of this information gap, the CSA has collected some data on how holders use their agricultural produce in the agricultural year to provide some information on the subject. The data were collected by interviewing the holders. They were asked to quantify their yearly crop utilization experience in percent based on common practice. Summary Tables V-13 – V-16 convey this information to shed some light on how holders utilize their crop produce. Information was sought for each crop type produced during the census year. The resulting data may help users to have some idea about crop usages by agricultural holders. In order to detect the differences in utilization of the various crops, it is better to look into the data by group of crops as categorized in the summary tables for simplicity and analogy.

Needless to say, as Summary Table V-13 points out, most of the cereal crops produced were used for household consumption. In Benishangul Gumuz Region more than 70 % of the cereals produced were used for household consumption. About 14 % and 11 % were used for sale and seed, respectively. The remaining 5 % of the cereals produced was used for

other purposes like wages, animal feed, etc. When the utilization is considered by crop type, it is easy to realize that between 60 % and 76 % of the crops in the cereals group were used for own consumption and between 9 % and 23 % of these crops were used for sale. Moreover, between 10 % and 25 % of the same crops in the same group were used for seed.

The pattern of utilization of pulses isn't much different either. As shown in Summary Table V-13 about 72 % of pulses were used for household consumption, 12 % for seed and 14 % for sale. The remaining 2 % of pulses were used for wages, animal feed and others. Considering utilization by crop type within the pulses group, between 46 % and 74 % of the crops were utilized for household consumption and 9 %-33 % of the same crops in the same group were sold in 2001/02 (1994 E.C.). Moreover, between 7 % and 21 % of these crops in the pulses group were also used for seed in the same year.

The picture of oilseeds utilization is distinctly different from that of cereals and pulses as portrayed in Summary Table V-13. About 60 %, 28 % and 10 % were used for sale, household consumption and seed, respectively. Taking utilization by crop type into account, between 17 % and 74 % of each crop type in the oilseeds category were used for household consumption, between 14 % and 71 % for sale and 6-13 % for seed. It may reasonably be summed up that more of the oilseeds produced are used for sale or as cash crops.

The percentage of vegetables consumed at home is even more than that of cereals and pulses. About 78 % and 19 % of the vegetables produced were used for household consumption and sale, respectively. The remaining percent were used for seed, wages, animal feed and others. The percent used by crop type with in the vegetables group were 59 %-100 % for household consumption, 12 %-37% for sale and 1 %-2 % for seed. For details, refer to Summary Table V-13.

The utilization of root crop production is the same as that of vegetables as indicated in the regional Summary Table V-13. About 77 % of the root crops were used for household consumption, 18 % for sale and about 5 % for seed. The ranges of percent utilized by crop

type within the root crops category fall between 53 %-94 % for consumption, 1 %-46 % for sale and 1 %-14 % for seed.

The permanent crop utilization is also different from that of cereals, pulses, vegetables and root crops. Thus, about 63 % of the crop was used for consumption at home and about 34 % for sale. The utilization by crop type within the permanent crop group ranges between 42 % and 77 % for household consumption and between 21% and 54% for sale. Permanent crops are also used as cash crops like oilseeds. It is rational to conclude by looking at Summary Table V.13 that the peasant farmers consume most of what they produce leaving little to sell.

Summary Table V-14 indicates that the pattern of crop utilization in the zones is similar to that of the region. In Metekel Zone, the percent of cereals used were 68 % for household consumption, 14 % for sale and 12 % for seed. Crop utilization in the zone for each crop in the cereal category ranged between 56 % and 77 % for household consumption, 9 %-18 % for sale and 9 % - 29 % for seed.

The utilization of pulses in the zone is about the same as cereals. About 67 % of the pulses produced were used for household consumption, 15 % for sale and 14 % for seed. The remaining 4 % were used for other purposes. The percent of pulses used by crop type in the pulses group varied between 9 % and 74 % for household consumption, 9 %- 71 % for sale and 7 %-21 % for seed.

As mentioned earlier in the regional description, oilseeds in Metekel zone are also used as a source of cash. About 22 % of the oilseeds grown in the zone were used for consumption at home, 63 % for sale and 11 % for seed. The usage of oilseeds by crop type within the category ranged from 13 %-73 % for household consumption, 15 % - 71 % for sale and 5 % - 13 % for seed.

The vegetable utilization in Metekel Zone is similar to that of the regional situation. Hence, about 78 % of the vegetables produced were consumed at home. Also about 16 % and 4 %

were used for sale and seed, respectively. The utilization of each crop in the vegetable group varied from 65 % to 100 % for household consumption, 10 %-22 % for sale and 1 % - 4 % for seed.

The data in Summary Table V-14 shows that most of the root crops produced in the zone were used for household consumption. More than 71 % of the root crops were consumed at home, about 16 % used for sale and 12 % for seed. The utilization by crop type within this group fluctuated from 41 % to 89 % for household consumption, 3 %-52 % for sale and 3 %-16 % for seed.

Permanent crops formed the second group used as a source of cash after oil seeds. As indicated in Summary Table V-14, about 36 % of the permanent crops were used for sale and 61 % for own consumption. The percent of usage of each permanent crop within the group varied between 15 % and 58 % for sale and 38 %-100 % for consumption at home. The observation that most of what is produced is used for own consumption still holds.

In Asosa Zone, the product utilization pattern is the same as the region and the other zones. The census result reveals that about 74 % of cereals were used for household consumption, 11 % for sale and about 11 % for seed. The percent of utilization of each crop in the cereal category ranged between 54 % and 82 % for household consumption, 7 - 37 % for sale and 8 - 22 % for seed.

Concerning pulses about 75 % of the pulses were used for household consumption, 14 % for sale and 11 % for seed. The percent of utilization by crop type within the pulses category varied from 58 - 85 % for household consumption, 5 - 26 % for sale and 9 – 16% for seed.

The data on oil seeds utilization in Asosa Zone give the same picture as that of the region and Metekel Zone. As shown in Summary Table V-15, about 58 % of the oil seeds were used for sale, 31 % for household consumption and 10 % for seed. The percent utilized by crop type within the oil seed category fall between 16 - 82 % for household consumption, 3 - 74 % for sale and 5 %-16 % for seed.

As mentioned earlier data on the pattern of crop utilization of vegetables and root crops was collected. The result shows that about 76 % of the vegetables grown were used for household consumption and 22 % for sale. The percent utilized by crop type in the vegetable category varied from 53 - 100 % for household consumption and 12 - 44 % for sale in Asosa Zone.

The utilization of root crops is the same as that of the vegetables. The data show that about 77 % of these crops were used for household consumption and 21 % for sale. The percent utilized by crop type within the group fluctuated from 40 - 96 % for household consumption and 2 - 60 % for sale.

For Asosa Zone, permanent crops are also second to oilseeds as a source of cash as portrayed in Summary Table V-15. Thus, about 66 % of permanent crops grown in the zone were used for household consumption and 30 % for sale. The percent utilized by crop type within the permanent crops group fall between 10 - 82 % for household consumption and 16 - 90 % for sale.

In Kemashi Zone, the way crops are utilized for various purposes is similar with the rest of the zones in region. Hence, about 69 % of the cereals produced were used for household consumption, 19 % for sale and 9 % for seed. The percent utilized by crop type within the group varied from 67 - 75% for household consumption, 10 - 20 % for sale and 8 - 28 % for seed.

The utilization of pulses in Kemashi Zone is about same as the other zones. As presented in Summary Table V-16, about 81 % of pulses were used for household consumption, 10 % for sale and about 9 % for seed. The percent utilized by crop type varied from 81 - 100 % for household consumption, 5 - 10 % for sale and 7 - 9 % for seed.

As in the other zones, the oilseeds produced in Kemashi Zone are also mainly used as a source of cash, where about 59 % of the oilseeds produced were sold, and 32 % used for

home consumption and about 8 % used for seed. The percent utilization of each crop in the group falls between 10 - 64 % for sale, 28 - 85 % for consumption and 4 - 11 % for seed.

Most of the vegetables produced are consumed like cereals and pulses in Kemashi Zone. More than 83 % of the vegetables were used for household consumption and about 15 % for sale. The percent of utilization of each crop in the group ranged from 81 - 98 % for consumption and 1 - 17 % for sale.

The picture of root crop utilization is the same as vegetable in the zone. More than 86 % of these crops were consumed and about 13 % were sold. The percent of each crop utilized fall between 68 - 99 % for household consumption and 12 - 26 % for sale.

The usage of permanent crops in Kemashi is similar to the other zones in the region. About 53 % of the crops were sold and 44 % consumed at home. The percent of each permanent crop used ranged between 34 - 100 % for sale and 8 - 65 % for household consumption. As in the other zones of the region, most of the agricultural produce in Kemashi zone is used for consumption.

TABLE 5.25.1 - CROP PRODUCTION AND PERCENT OF UTILIZATION
